🎙️ GoGospelNow.com Meeting Recorder

User Guide & Feature List

Crosswinds Church · **https://meeting.acts19.us** · November 3, 2026

Record or upload a meeting and get a written transcript with speakers separated, AI summaries, action items, and notes — all searchable and exportable. Everything runs on the church's own servers; no meeting audio leaves the building.

What it does, in one line each

📝 Transcribes automatically

Upload a phone memo or Zoom recording, or record live in the browser. Speech becomes text with timestamps.

👥 Separates speakers

Each voice gets its own label, then you give those labels real names (Ken, Dana…) and every export uses them.

✨ Summarizes with AI

Key Points, Decisions Made, Action Items (who/what/when), and Open Questions — regenerated on demand.

🗒️ Keeps your notes

Add your own notes beside the transcript; they stay with the meeting and are listed with times.

⬇️ Exports anywhere

Copy, download .txt or .md, or save straight to Google Drive. Every export is logged.

🔒 Private by default

Each person sees only their own meetings. Audio is never downloadable without signing in as its owner.

Quick start (60 seconds)

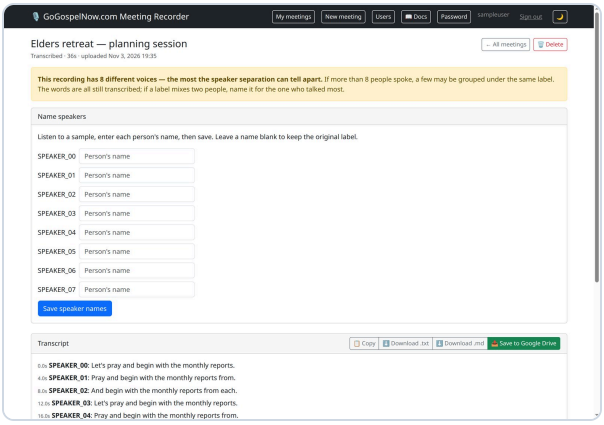

1. Open **https://meeting.acts19.us** and sign in.
2. Click `+ New meeting`.
3. Give it a title, then either pick an audio file *or* click `● Start recording`.
4. Click `Upload & transcribe` and wait for the status to turn **Transcribed** ✅.
5. Open the meeting: name the speakers, read the transcript, click `✨ Summarize with AI`, and export.

Works on phone too. The interface is mobile-friendly, so you can record straight from your phone's browser while the meeting is happening — no app to install.

1. Getting started

Signing in

Go to **https://meeting.acts19.us**. You'll land on the sign-in page and use the username and password an administrator created for you — there's no self sign-up and no Google/Microsoft account needed.

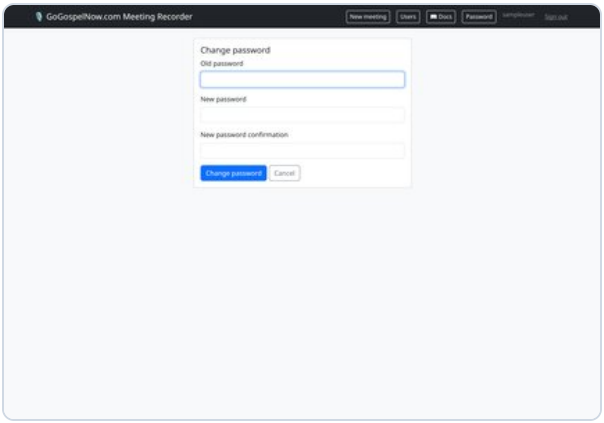

The sign-in page. Accounts are created for you by an administrator.

The top bar

Button	What it does
🎙️ **My meetings**	Back to your meeting list from any page.
➕ **New meeting**	Upload an audio file or record live.
🌙 **Dark mode**	Light or dark theme; your choice is remembered.
👥 **Users**	Manage accounts — *only visible to administrators*.
📖 **Docs**	Download this user guide as a PDF (the copy in the app is always current).
🔑 **Password**	Change your own password.
Sign out	Ends your session. Do this on shared computers.

Changing your password

1. Click `Password` in the top bar.
2. Enter your current password, then the new one twice.
3. Click `Change password` — you stay signed in.

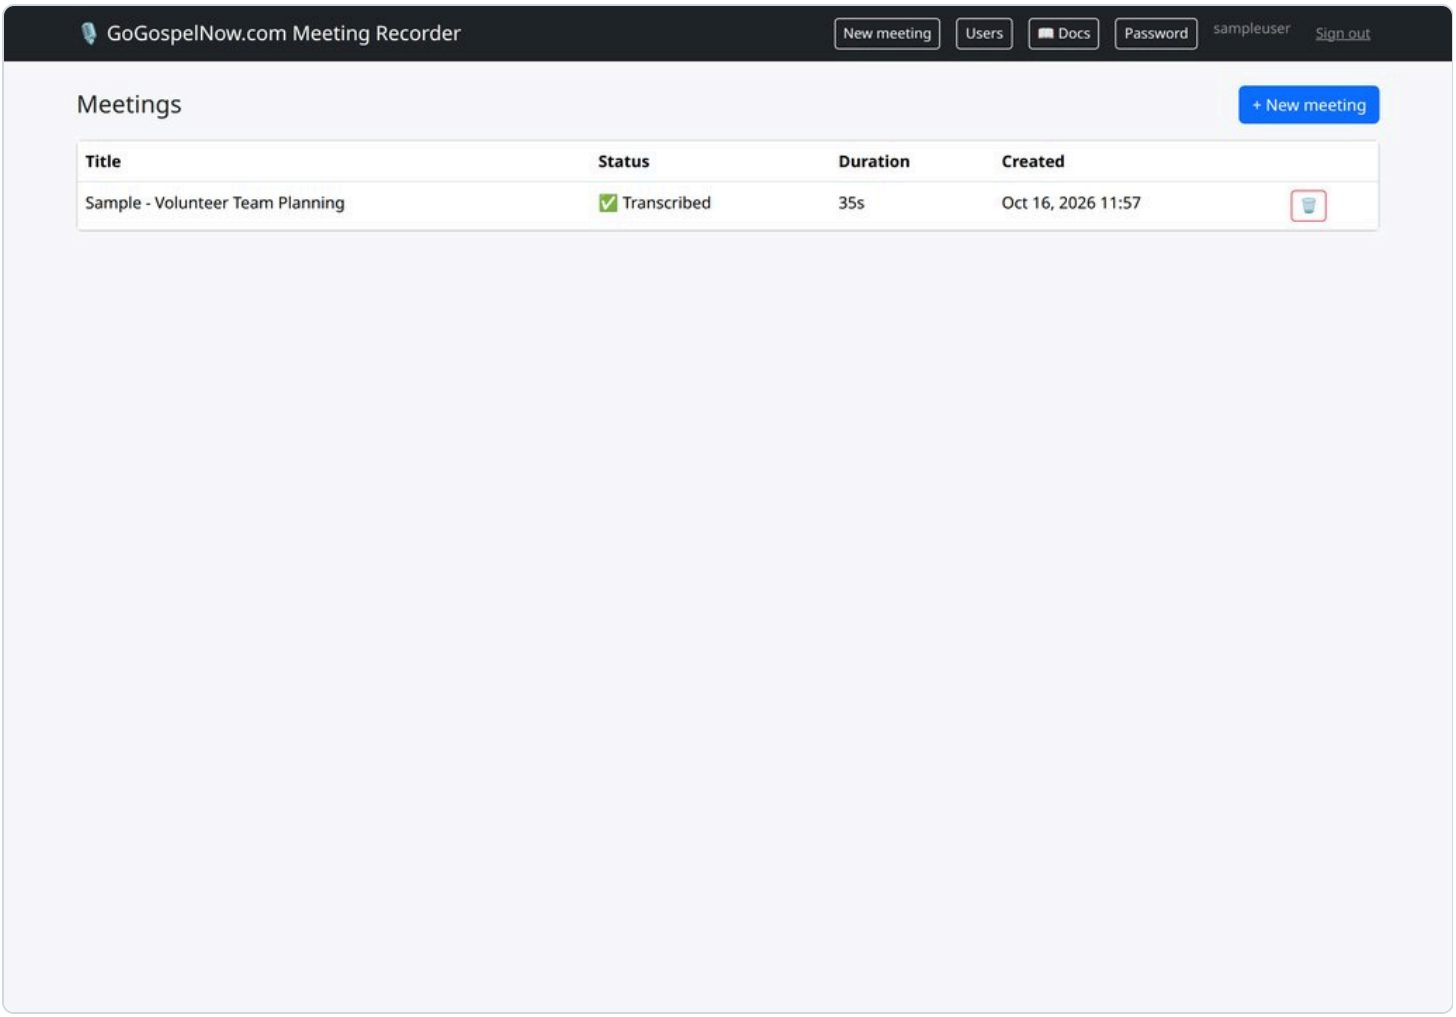

Change your own password any time from the top bar.

> **Password rules:** 8+ characters, not all numbers, not common, not close to your username.

2. The meeting list

Your home page. Every meeting you own is listed with its status, length, and creation date. Click any row to open it.

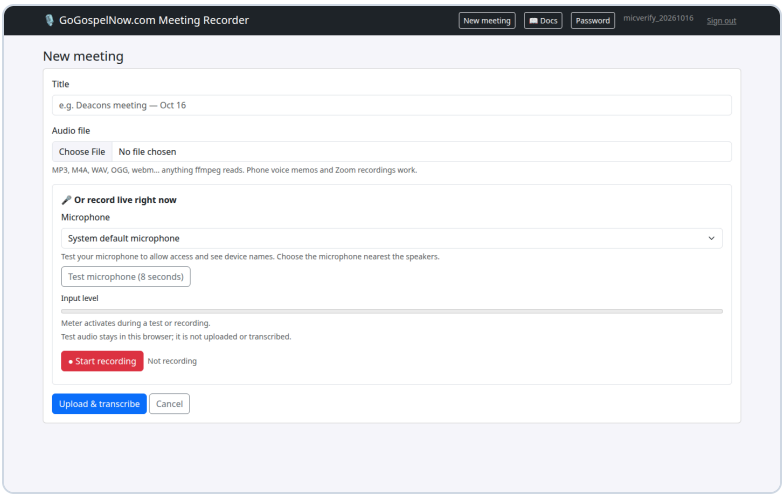

The meeting list — click a row to open, or the 🗑 button to delete.

Status	Meaning
📤 **Uploaded**	Saved — waiting its turn to be transcribed.
⏳ **Processing**	Being transcribed and split by speaker right now.
✅ **Transcribed**	Done — transcript, speakers, summaries, and exports are available.
❌ **Failed**	Something went wrong; open the meeting to see the reason, then re-upload.

You only see your own meetings. Each account has its own list, so a shared login is never needed and nobody else's recordings appear in your account.

3. Recording or uploading a meeting

The New meeting page, including microphone setup controls.

Option A — Upload an existing recording

1. Type a title that will make sense later (for example *Deacons meeting — Oct 16*).
2. Under **Audio file**, choose the file. MP3, M4A, WAV, OGG, and video files all work — phone voice memos and Zoom recordings are fine.
3. Click `Upload & transcribe`.
4. The meeting appears in your list as ⏳ **Processing**. Leave the page; it keeps working. Longer recordings take longer — roughly a minute of processing per ten minutes of audio.

Option B — Record live in the browser

1. Type a title.
2. Click `● Start recording` and allow microphone access when the browser asks (this is why the site uses a secure `https://` address).
3. Talk normally. A **Live transcript preview** fills in roughly every 10 seconds while you record, so you can see the transcription is working.
4. Click `■ Stop` when the meeting ends, then `Upload & transcribe` to run the full, higher-quality pass.

Two things happen at once while you record. The whole meeting is saved as one continuous file for the final transcript, while short preview clips are sent for the live text. The preview is a preview — the finished transcript after you stop is the one to trust.

Keep the tab open while recording — recording happens in the browser, and closing it (or locking some phones) can stop it. A "hiccup" line in the preview only means one short clip was skipped; your recording is fine.

3a. Check your microphone before recording

A clear recording gives speech recognition the best chance of getting the words right. A louder signal alone does not fix noise, echo, overlapping speech, or unfamiliar names.

1. On **New meeting**, click **Test microphone (8 seconds)** and allow microphone access when prompted.
2. Speak normally. Watch the **Input level** meter. The test stops automatically.
3. Press Play on the test audio player. Listen for clear voices, background noise, and distortion. Test audio stays in your browser: no meeting is created and nothing is uploaded or transcribed.
4. Use the **Microphone** dropdown to choose your external or conference microphone. Device names become available after permission is granted. Run the test again after changing microphones.
5. When satisfied, click **Start recording**. Your selected microphone feeds both the continuous recording and live transcript preview. The meter stays active. Microphone selection and testing are locked until you stop.

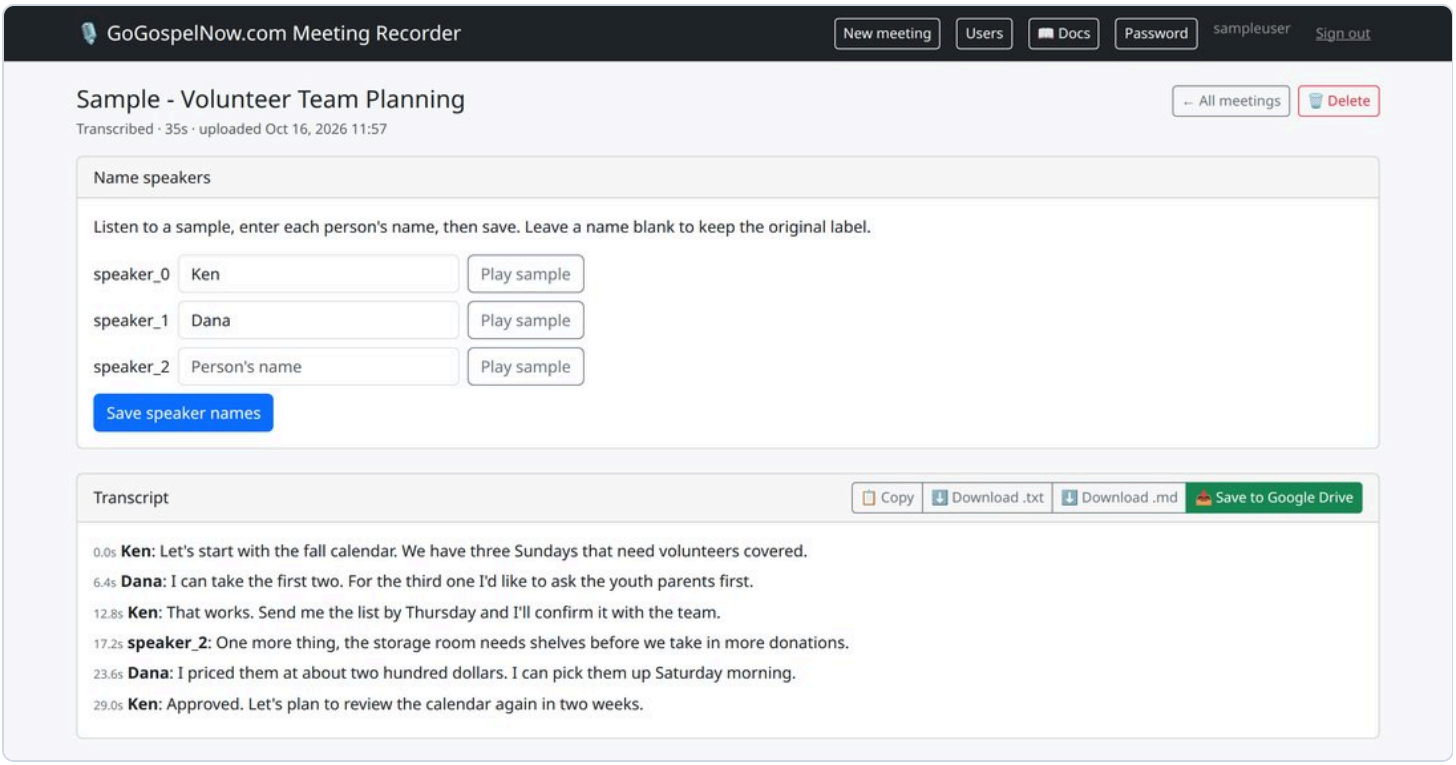

Meter message	What to do
Quiet or silent	Normal during pauses. If it stays low while speaking, move closer or check the device input level.
Healthy level	The level is usable; still listen to the test for noise or distortion.
Too loud / possible clipping	Lower input level in your device settings or move the microphone farther away. Distortion already captured cannot be repaired by turning playback down.

No volume slider is needed to begin. These controls help you choose and check the input. They do not change hardware gain or guarantee perfect transcription.

If access fails: allow microphone permission for this HTTPS site, reconnect the microphone, or close another app using it. Then try again. The meter is an approximate guide, not a calibrated sound-level measurement.

4. Working with a meeting

Everything happens on one page. From top to bottom:

Meeting header, speaker naming, and the start of the transcript.

👥 Name the speakers

Diarization splits the audio into voices but can't know names, so you map them once:

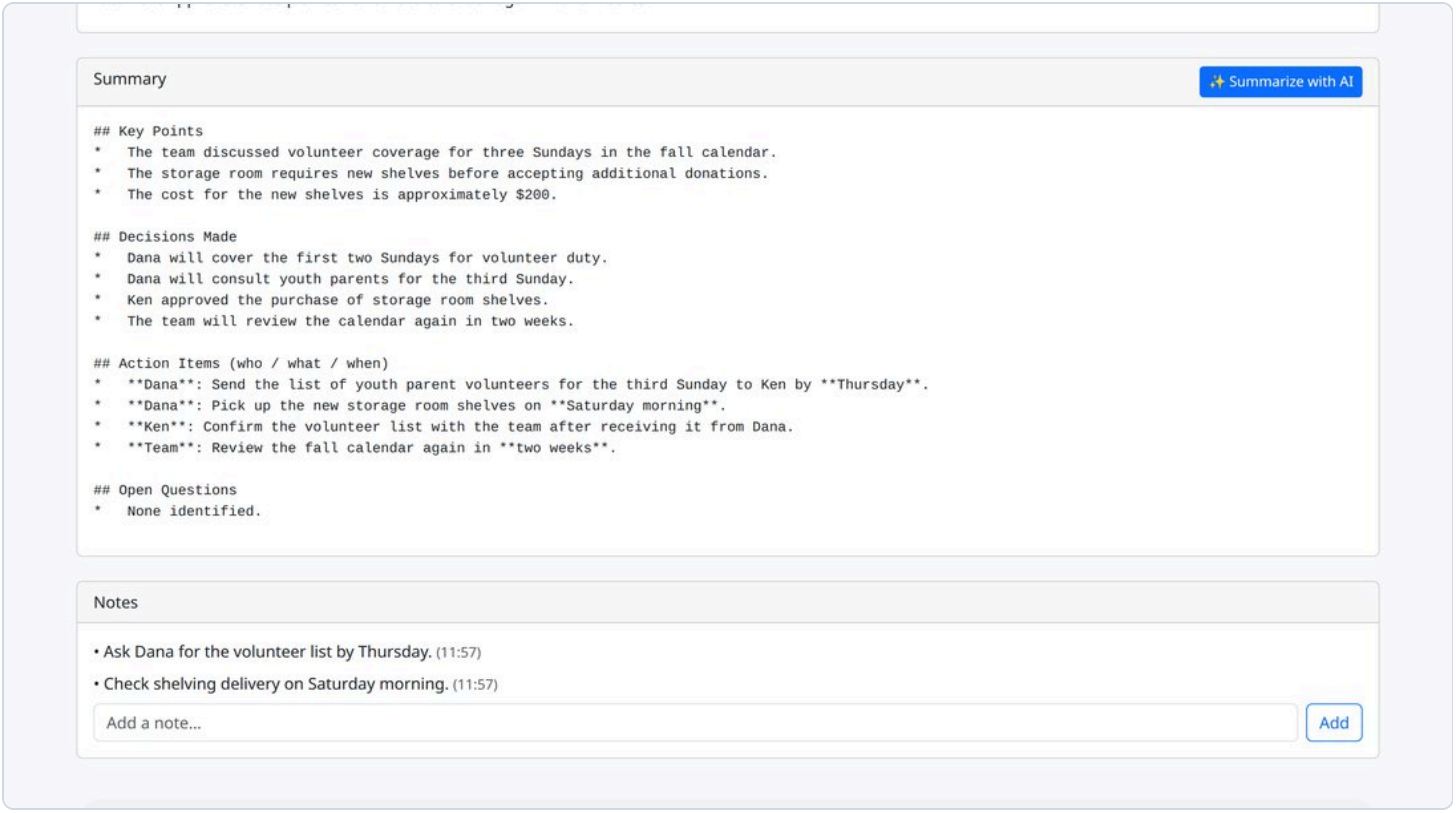

1. Click `Play sample` next to a speaker to hear a few seconds of that person.
2. Type the person's name in the box (up to 100 characters).
3. Click `Save speaker names`.

The transcript, the downloads, and any summary you generate afterwards all use those names. Leave a box blank to keep the original label. Naming never re-runs transcription, so it's instant.

📝 The transcript

- Each line shows a timestamp and who spoke, colour-coded per speaker.
- **Click a timestamp** to jump the audio player to that moment.
- Use `📋 Copy` to copy the whole transcript to your clipboard.
- `⬇️ Download .txt` gives a plain transcript; `⬇️ Download .md` gives a formatted version for notes apps and documents.
- `📤 Save to Google Drive` writes the transcript into your Drive in one click.

5. Summary, notes, and deleting

AI summary, your notes, and the audio player at the bottom of the page.

✨ AI summary

Click `✨ Summarize with AI` and the page fills in four sections:

Section	What you get
Key Points	The main things discussed.
Decisions Made	What the group actually settled on.
Action Items	Who does what, and when.
Open Questions	Anything left unresolved.

Summaries are generated on the church's own AI server. Click the button again any time to regenerate — naming the speakers first makes the action items name real people.

🗒️ Your notes

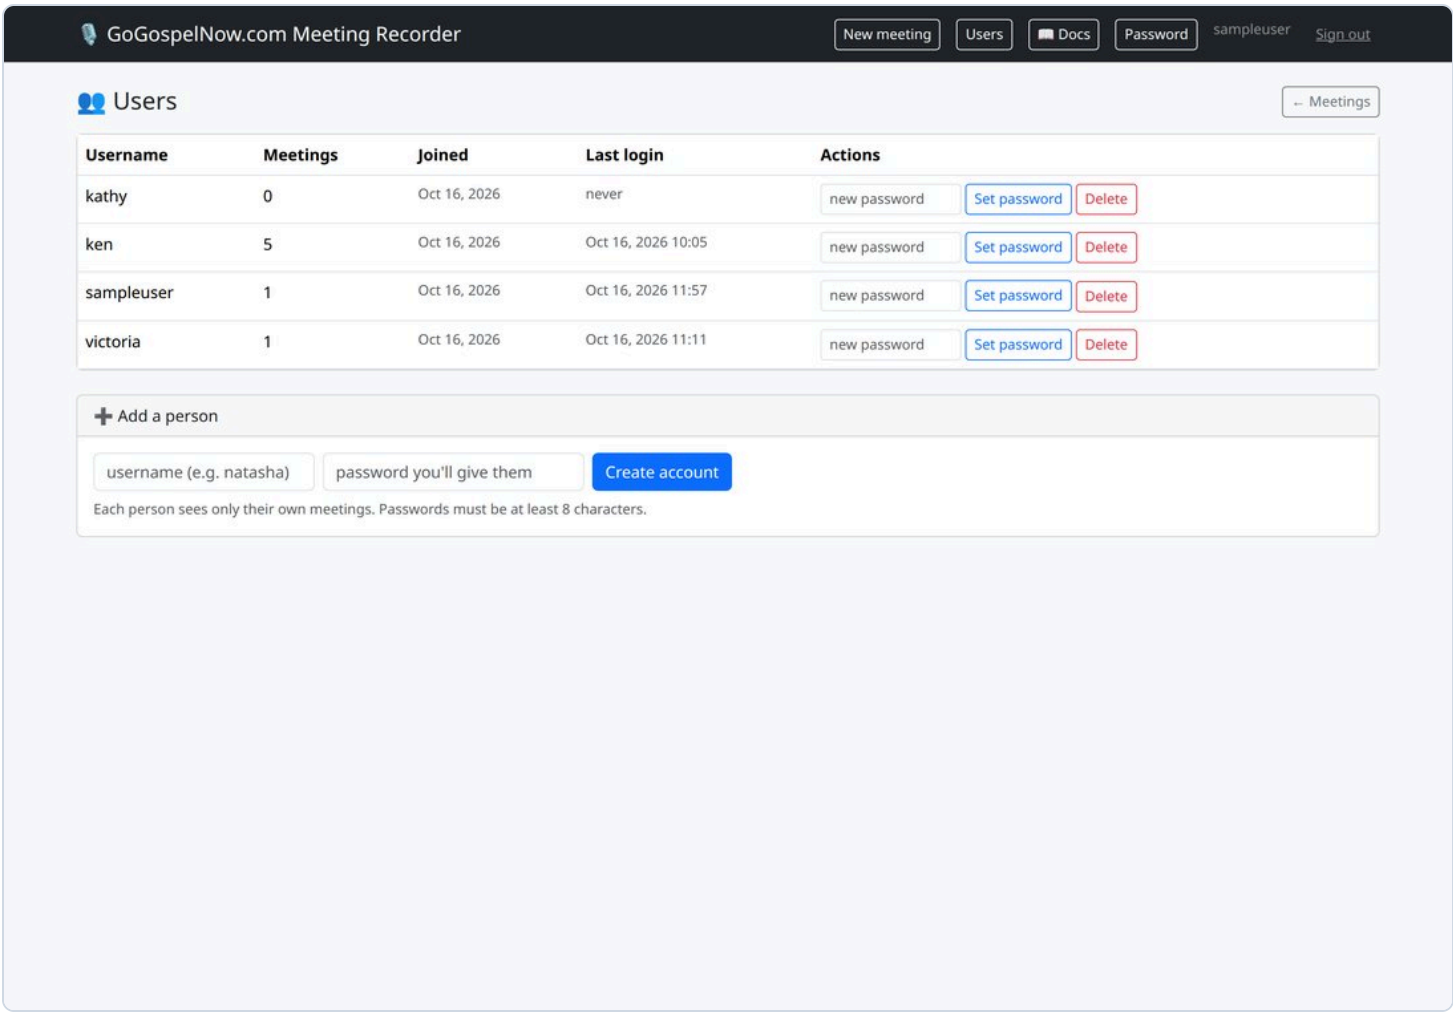

Type in the **Add a note…** box and click `Add`. Notes are listed with the time you wrote them and stay attached to that meeting — handy for your own follow-ups alongside the AI summary.

🗑️ Deleting a meeting

> **Deleting is permanent.** It removes the audio file, the transcript, the summary, your notes, and the export history for that meeting — there is no recycle bin. You'll get a confirmation page listing what will be removed; only the meeting's owner can delete it.

6. Managing users (administrators only)

Click `Users` in the top bar. Anyone with an account can use the recorder, but only administrators see this page — regular users never see the Users button at all.

The Users page: the list of accounts, password reset, delete, and the create form.

Create an account for someone

1. In the **Create account** row, type the username (for example `natasha`) and the password you'll hand them.
2. Click `Create account`.
3. Give them the address and their password, and tell them to change it on first sign-in via the Password button.

Reset someone's password

Type a new password in the box on their row and click `Set password`. They keep all their existing meetings — only the password changes.

Remove an account

Click `Delete` on their row. **This takes their meetings with it**, so only delete an account when the recordings genuinely aren't needed any more.

> **Rules worth remembering:** usernames are unique and there's no self-service "forgot password" page — an administrator resets it. New accounts can't see another person's meetings, ever.

7. Feature list

Feature	Details
🎤 **Live browser recording**	Record directly from a phone or computer; no app to install. Saved as one continuous file.
👁️ **Live transcript preview**	Text appears about every 10 seconds *while* you are still recording, so you can confirm it's working.
🌙 **Dark mode**	One click switches the whole app to a low-glare dark theme that follows your device's setting until you choose.
♻️ **Interrupted-recording recovery**	Every 10-second preview clip is kept on the server, so a recording whose browser tab closed can be rebuilt up to the last clip.
📤 **File upload**	MP3, M4A, WAV, OGG, WebM and video files — anything a phone voice memo app or Zoom produces.
📝 **Automatic transcription**	Fast on-server speech-to-text with word timestamps; runs locally, no per-minute cloud fees.
👥 **Speaker separation**	Voices are split into distinct speakers (speaker_0, speaker_1, …) and shown in different colours.
🏷️ **Speaker naming**	Give each voice a real name with sample playback; names flow into the transcript, downloads, and summaries.
✨ **AI summary**	Key Points, Decisions Made, Action Items (who / what / when), and Open Questions; regenerate on demand.
🗒️ **Notes**	Unlimited personal notes per meeting, timestamped, listed with the meeting for as long as it exists.
📋 **Copy**	One click copies the full transcript (with names) to the clipboard.
⬇️ **Downloads**	.txt for plain text, .md for formatted markdown.
📤 **Google Drive**	Save the transcript straight into Google Drive; each export is recorded in the meeting's export history.
🔎 **Click-to-seek audio**	Click any timestamp to hear that exact moment of the original recording.
👤 **Separate accounts**	Admin-created users, each with their own meeting list; nobody sees anyone else's recordings.
🔑 **Self password change**	Users change their own password; admins can reset any password without touching that person's meetings.
🗑️ **Delete**	Owner-only deletion with a confirmation page; removes audio, transcript, notes, and exports together.
📖 **Built-in user guide**	The **Docs** button downloads this guide as a PDF.
🔒 **Private by default**	Sign-in required, HTTPS only, secure cookies, audio served only to its owner, pages excluded from search engines.

What it doesn't do (yet)

- **Ask questions about a meeting** — a chat box for "what did we decide about the budget?" is the next feature planned.
- **Rename individual transcript lines** — speaker names apply to that speaker across the whole meeting, not line by line.
- **Recover a deleted meeting** — deletion is permanent.
- **Scheduling or calendar links** — the recorder is for meetings you record or upload yourself.

8. Good to know

How accurate is it?

Strong on clear speech and typical meeting audio; rougher with heavy cross-talk, very soft speakers, noisy rooms, or heavy jargon (Bible book names, for example). Naming the speakers afterwards clears up most of it.

Meetings with more than 8 people

Speaker separation can tell apart up to **eight voices** — that is the hard limit of the diarization model, and the app tells you when a recording reaches it:

The heads-up that appears on a meeting with eight different voices.

Nothing breaks and no audio is lost: **every word is still transcribed correctly.** Only attribution changes — with more than eight voices, a few quieter people may be grouped under someone else's label, and a label can carry only one name. Name it for the person who talked most and read the transcript for the rest.

What about my privacy?

- Audio and transcripts stay on the church's own server — nothing is sent to an outside AI provider.
- The connection is encrypted, and recordings are only reachable by the account that owns them.
- Pages are marked "no index", so search engines won't list them, and deleting a meeting removes its audio from the server.

How fast should I expect it to be?

Recording length	Typical wait after you click transcribe
Up to 10 minutes	Usually under 2 minutes.
30 minutes	A few minutes — start it and come back.
60 minutes or more	Under 10 minutes; leave the tab or go do something else.

If something goes wrong

Symptom	What to do
Page says ❌ **Failed**	Open the meeting and read the reason line. The usual causes are an unsupported file or an interrupted upload — convert to MP3 or M4A and upload again.
Stuck on ⏳ **Processing** for a long time	Long recordings genuinely take a while. Give it a few minutes, then refresh. If the server was restarted mid-job, re-upload.
Browser won't let you record	Microphone access needs a secure `https://` address — use the **meeting.acts19.us** link, not an IP address. Check the site's microphone permission if you clicked "block".
The live preview shows a hiccup warning	Recording is fine; one short preview clip was skipped. The final transcript is unaffected.
Signed out unexpectedly	Sign in again — sessions end after a long idle period. Nothing already transcribed is lost.

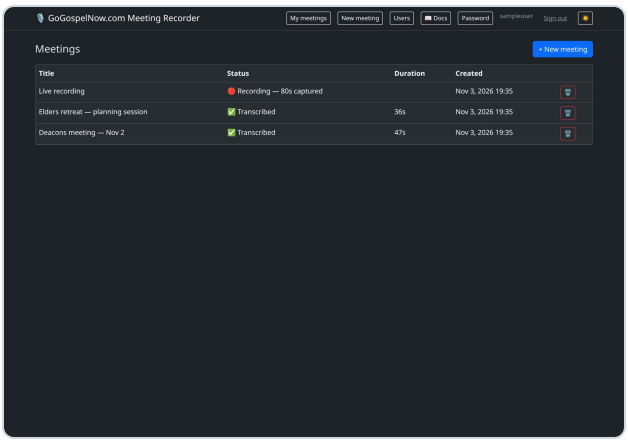

One habit that pays off: name the speakers before you click `Summarize with AI`, so the summary says "Dana will cover the first two Sundays" instead of "speaker_1 will…".

9. Dark mode, and a recording that got interrupted

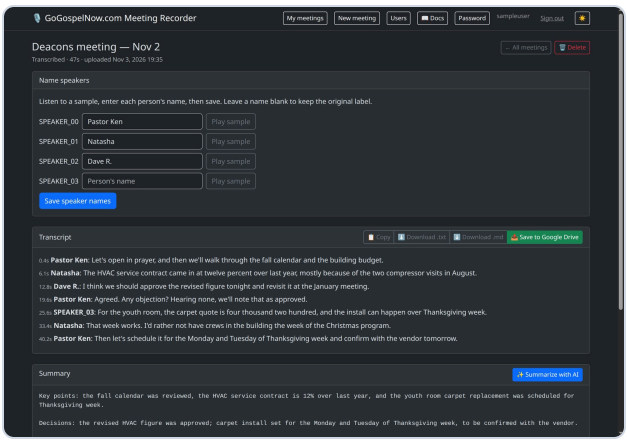

🌙 Dark mode

Click the moon in the top bar to switch the whole app to a dark theme; the button becomes a sun to switch back. The first time you visit, the app follows your device's setting (light or dark). Once you choose, that choice is remembered in that browser — phone, tablet and computer each remember their own.

The transcript, speaker names and the red recording indicator stay legible in both themes, so you can leave the app dark during an evening meeting without losing contrast.

The meeting list in dark mode — the moon becomes a sun.

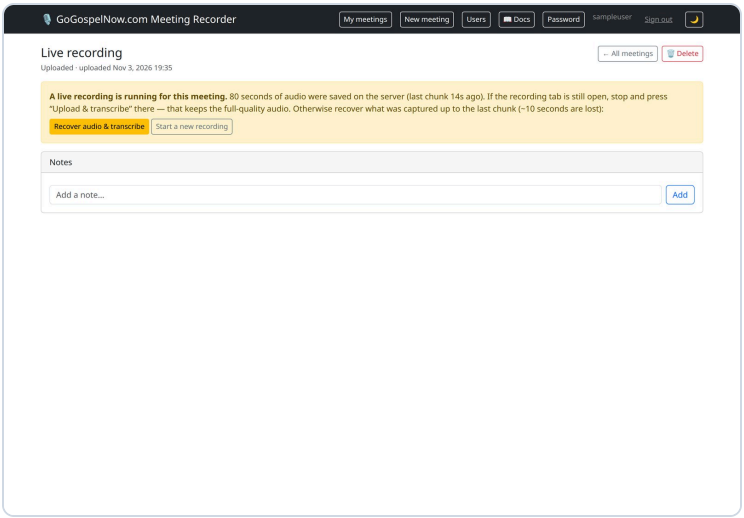

A meeting in dark mode: speaker naming and the transcript.

♻️ If a recording gets interrupted

While you record, the browser sends a short preview clip every ten seconds so the transcript can appear live. Those clips are now kept on the server. If the tab is closed, the laptop sleeps, or the browser crashes, the recording is not lost outright — open the meeting from **My meetings** and click **Recover audio & transcribe**.

Before that happens, the app warns you: closing or refreshing the page mid-recording asks for confirmation first, and an unfinished meeting shows as 🔴 **Recording** (still running) or ⚠️ **Not uploaded** (tab gone) in the list instead of looking like a finished upload.

An interrupted meeting offers to rebuild the audio from the saved clips.

> **Expect to lose the last few seconds.** Recovery rebuilds everything up to the last complete ten-second clip, so up to about ten seconds at the very end may be missing. If the recording tab is still open, stop and upload there instead — that keeps the full-quality audio.
